

SEO Audit — funngro.com

Krishna Yadav — Funngro Website Revamp project

I went through funngro.com's homepage to check how well it's set up for search engines (Google), before starting my own 2-page design. I checked the page source (view-source in browser) to see the title, meta tags and description Google would actually use. Here's what I found and what I think should change.

1. No proper meta description

The homepage doesn't have a normal meta description tag — the kind that shows up as the small grey text under a link in Google search results. It only has description tags meant for WhatsApp/Instagram link previews (Open Graph tags), not the one Google actually reads for search snippets.

This matters because without it, Google just picks random text from the page to show in search results, which usually looks messy and doesn't make people want to click. This is probably the easiest fix with the biggest impact.

Suggested description for the homepage:

"Funngro connects 70 lakh+ Indian teens with 5000+ brands for paid gigs — content, social media, campus ambassador roles and more. Free, instant UPI payouts."

2. Not sure if there's one clear H1 heading

Every page should have one main heading (H1 tag) that tells Google what that page is about. A lot of sites built with page builders end up with styled text that looks like a heading but isn't actually coded as one, so Google can't tell what the page's main topic is.

I couldn't confirm this from the page source alone since the visual builder hides it, but it's worth double-checking directly in the CMS. If it's missing, it could be hurting how well the site ranks for terms like "earning app for teens" or "teenlancer".

3. Keywords are too generic

The keywords in the page source are: funngro, teen earner, teenlancer, earn online india, gen z earn, brand promotion app, upi earnings. These are mostly just brand name variations, not the kind of specific phrases someone would actually type into Google, like "earn money online as a student in India" or "hire Gen Z creators in India".

Google doesn't rely much on the keywords tag anymore, but it reflects a real gap — the actual page content should be written around specific searches like these instead of repeating the same brand terms everywhere.

4. No canonical tag

I didn't find a canonical tag on the page. This tag tells Google which exact version of a URL to treat as the "real" one (for example, with or without www). Without it, Google can end up splitting ranking value across slightly different versions of the same page instead of putting it all behind one strong URL. It's a small fix but worth adding.

5. What's already working well

- The page title is clear and includes the brand name properly.
- Open Graph and Twitter card tags are complete, so links shared on Instagram/WhatsApp show a proper preview image, title and description.
- The mobile viewport tag is set up correctly, which matters since Google ranks mobile-friendliness.
- The brand color (#0B0F0D) is set as the theme color, so it shows up consistently even in the mobile browser bar — small detail but good for brand recall.

6. What I did differently in my revamp

For the 2-page website I built (Home + For Companies), I made sure to fix the issues above from the start — a proper meta description on each page, one clear H1 per page, a canonical tag, and headings/content written around a specific search intent for each page instead of repeating the same pitch twice.
